

XAMS

Xiting Authorizations Management Suite

The ultimate solution for efficient authorization projects

Auditing standards and legal regulations require companies to manage authorizations in a restrictive manner. This inevitably leads to a revision of existing authorization concepts or the creation of entirely new ones.

The implementation of authorization projects can be challenging, as it requires a professional understanding of the underlying business processes, as well as a profound technical knowledge of SAP authorizations.

The Xiting Authorizations Management Suite (XAMS) makes this process easier and more efficient by significantly shortening critical and time-consuming phases in SAP authorization projects and helping to ensure their successful completion.

XAMS offers a best-practice approach for the holistic management of SAP authorizations in the ABAP environment, known as the Xiting Authorizations Life Cycle. Following our motto "Get clean, stay clean", XAMS supports you in creating "clean" roles based on the least privilege principle. Don't let authorization projects hold your business back. Trust XAMS to make the process efficient and successful.

- With XAMS, you can save time and resources on SAP ABAP authorization projects, with an estimated 65% reduction in time compared to manual creation and assignment of authorizations. XAMS is designed to streamline the authorization process, making it more efficient and effective, while also ensuring compliance with industry standards.
- The XAMS test standards are based on the SAP Security Guidelines of the German SAP User Group (DSAG) for ERP systems, ensuring that your organization's authorization management is in line with the best practices and recommendations of leading industry experts.

MAXIMIZE LARGE SAVINGS POTENTIAL!

Welcome to the next generation of authorization management! XAMS is more than just an individual software solution, it is a versatile and extensive software package that covers a wide variety of issues related to the management of SAP authorizations.

Role Designer

- Modeling and creation of roles and SAP Fiori content based on the least privilege principle for a secure and sustainable authorization concept
- Checking of critical authorizations and segregation of duties during role design
- Virtual cockpit to model and simulate changes to roles and its content

ABAP Alchemist

- Identification and optimization of existing or missing authorization checks in custom code
- Automatic updating of authorizations proposals in transaction SU24
- Improvement of the quality and stability of custom developments through best practice recommendations

Role Replicator

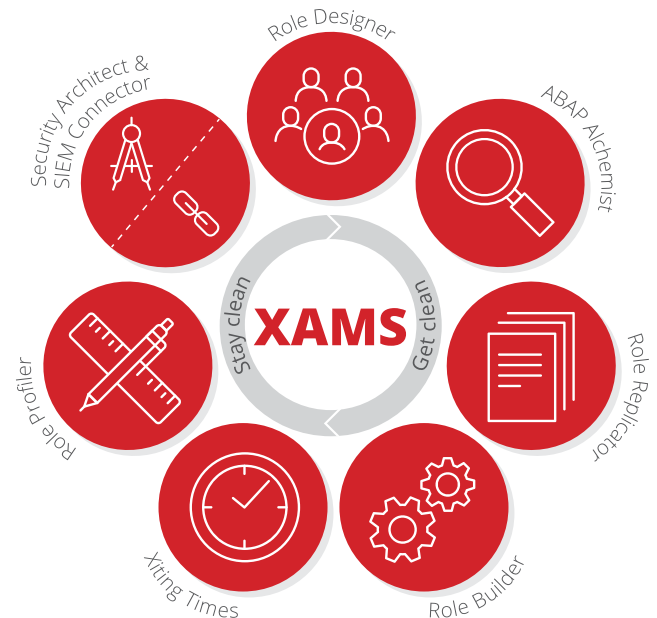

- Mass processing tools for roles, users, parameter transactions and SAP Fiori objects
- Efficient mass processing, analysis, and management of the organizational levels in a user-friendly interface for derived roles

Role Builder

- Automatic identification of authorizations with background simulation directly in production, subject to strict compliance with security requirements (DSAG test guidelines and SAP best practices)
- Analysis and processing of the simulation data from the productive test simulation (PTS) to finalize role definitions

Xiting Times

- Effective fallback scenarios to mitigate the risk when rolling out new authorizations
- Establishing an audit-compliant process for the provision of privileged/critical authorizations
- Emergency access management (Firefighter) scenarios

Role Profiler

- Comprehensive analysis tool with more than 100 reports to examine SAP authorizations for qualitative aspects and risks
- Ensuring the quality and sustainability of the implemented authorization concepts with integration to the transport management system (STMS)

Security Architect

- Automatic generation of system-related SAP security concepts considering best practice recommendations
- Centralized validation of the system settings against the SAP security concept

SIEM Connector

- Real-time reporting of security events to any SIEM system and/or email notification
- Advanced algorithms to correlate events and identify potential security threats
