

License-optimized SAP S/4HANA Transformation

Quick and easy implementation of a license-optimized role and authorization concept in SAP S/4HANA

Get a comprehensive overview of the license changes and innovations in SAP S/4HANA. Identify optimization potential regarding your user licenses.

The „minimum principle“ and „needs-based roles“ are common requirements in the SAP authorization world. With the switch from usage-based to authorization-based license measurement in S/4HANA and the introduction of new S/4HANA user licenses, implementing

these principles in your authorization concept is more important than ever. This is the only way to avoid over-licensing in S/4HANA. The associated changes and the effort involved are difficult to assess for many companies.

This service at a glance:

- Installation and configuration of the software solution XAMS in your SAP system landscape, including temporary usage license
- Implementation of the currently valid SAP license rules for an authorization-based analysis
- License analysis based on the existing authorization data for users and roles
- License analysis based on ST03N usage data and forecast of the expected S/4HANA licenses required
- Creation of a results document
- Presentation of results as part of a final meeting

INTEGRATION OF THE SAP LICENSE RULESET IN XAMS

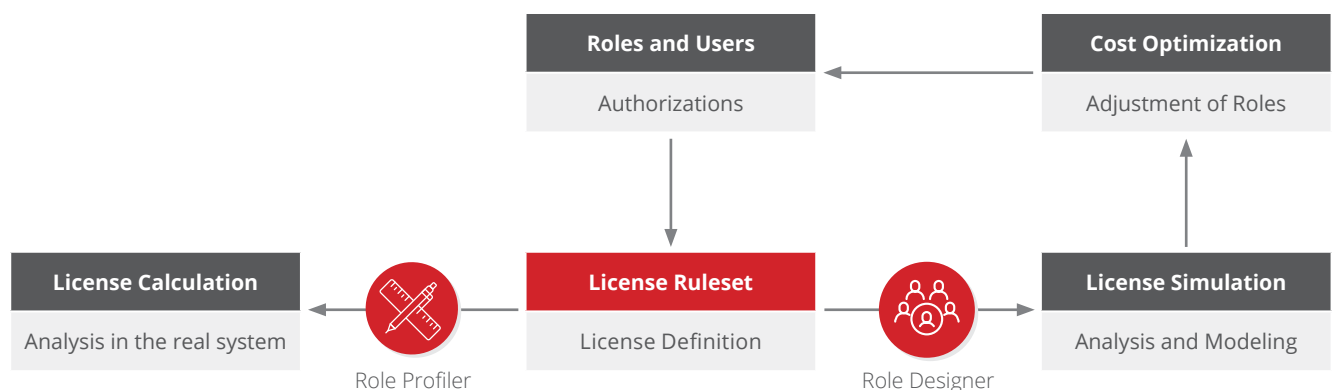

The integration of SAP's official license ruleset (see note [3113382](#)) in the Xiting Authorizations Management (XAMS) increases the transparency and enables you to determine licenses in a traceable manner as well as the creation of a license-optimized role and authorization concept in our XAMS tool Role Profiler.

The interaction with our Role Designer tool in particular offers you considerable added value. This is because while you are modeling roles in a virtual environment, a check against the license ruleset can be carried out automatically. This means that the correct license types for roles and users are determined at an early stage and taken into account during role design.

This provides you with immediate feedback on changes and allows you to uncover possible potential for reducing license costs. With optimized SU24 default values, the informative value is also continuously improved and therefore more reliable.

The ideal time to optimize user licenses is during a migration to S/4HANA or as part of a redesign project.

Our XAMS enables you to take license optimization into account as part of these activities or in preparation for them.
